Temperature Indicating Controller, Model CS3S
To prevent accidents arising from the use of this controller, please ensure the operator using it receives this manual.

⚠️ Caution

- This instrument should be used according to the specifications described in the manual. If it is used outside the specifications, it may malfunction or cause fire.
- Be sure to follow the warnings, cautions and notices. If not, it could cause serious injury or malfunction.
- Specifications of the CS3S and the contents of this instruction manual are subject to change without notice.
- Care has been taken to assure that the contents of this instruction manual are correct, but if there are any doubts, mistakes or questions, please inform our sales department.
- Be sure to turn the power supplied to the instrument OFF when cleaning.
- Wipe the instrument dry using soft cloth or cotton.
  (If the paint thinner is used for wiping, the instrument may be deformed or discolored.)
- The display parts are more easily damaged. Do not strike them with hard objects or press hard on them.
- Any unauthorized transfer or copying of this document, in part or in whole, is prohibited.
- WIKA is not responsible for any damages or secondary damages incurred as a result of using this product, including any indirect damages.

(1) PID, PD and ON/OFF action are programmable.
(2) 9 types of alarm action and no alarm action are selectable.
(3) The input configuration can be selected from the user by the front keys.
(4) Please note, that from these options only one can be selected.
(5) Condition for this option is the screw type mounting bracket (FS).
2. Name and functions of the sections

(1) PV: PV display
   Indicates the Process variable (PV) with a red LED.

(2) SV: SV display
   Indicates the Setting value (SV) with a green LED.

(3) AT: Auto-tuning action indicator
   The dot at the end of the PV display blinks while the Auto-tuning or Auto-reset is performing.

(4) OUT: Control output action indicator
   A green LED lights when the control output is on.

(5) A1: Alarm 1 (A1) output action indicator
   A red LED lights when the Alarm 1 (A1) output is on.

(6) A2: Alarm 2 (A2) output action indicator (Option: A2)
   A red LED lights when the Alarm 2 (A2) output is on.

(7) HB: Heater burnout alarm output action indicator (including Sensor burnout alarm) [Options: W1x]
   A yellow LED lights when the Heater burnout alarm or Sensor burnout alarm output is on.

(8) Increase key:
   Increases the numeric value or selects the setting value.

(9) Decrease key:
   Decreases the numeric value or selects the setting value.

(10) Mode key:
   Selects the setting mode or registers the setting value by pressing this key.

(11) OUT/OFF key:
   Turns the control output on or off.

[Fig. 2-1]

3. Operation

3.1 Messages on the displays after power on

The PV display indicates the character of the sensor type and temperature unit, and the SV display indicates the rated scale maximum value for approx. 2 seconds after the power is turned on. See [table 3.1-1]. (When any other value is set at the Main setting value high limit setting, the SV display indicates the value.) During this time, all outputs and LED indicators are in their off status. After that, the PV display indicates actual temperature, SV display indicates main setting value and control starts.

When the control output OFF function is working, is indicated on the PV display.

To release the control output OFF function, press the key for 1 second.

</tbody>
</table>
Loop break alarm time setting
- Sets the time to assess the Loop break alarm.
- This setting item is available only when the option [2AR] or [2AL] is applied.
- 0 to 200 minutes
0 min.

Loop break alarm action span setting
- Sets the temperature span to assess the Loop break alarm.
- This setting item is available only when the option [2AR] or [2AL] is applied.
- 0 to 150 °C (°F)
0°C

Loop break alarm
The alarm will be activated when the process variable (PV) does not rise as much value as the span or greater within the time it takes to assess the loop break alarm after the manipulated variable has reached 100% or the output high limit value.
The alarm output will also be activated when the process variable (PV) does not fall as much value as the span or greater within the time it takes to assess the loop break alarm after the manipulated variable has reached 0% or the output low limit value.
When the control action is Direct (Cooling), the alarm acts conversely.

3.5 Auxiliary function setting mode 1

<table>
<thead>
<tr>
<th>Character</th>
<th>Name, Description, Setting range</th>
<th>Initial</th>
</tr>
</thead>
</table>
| L $\sigma$ | Setting value lock designation
- Locks the setting value to prevent errors.
The setting item to be locked is dependant on the designation.
- PID auto-tuning or auto-reset will not function if Lock 1 or Lock 2 is designated.
- $\sigma\sigma\sigma$ (Unlock): All setting values can be changed.
- $\sigma\sigma\sigma\sigma$ (Lock 1): None of the setting values can be changed.
- $\sigma\sigma\sigma\sigma\sigma$ (Lock 2): Only main setting value is changeable.
- $\sigma\sigma\sigma\sigma\sigma\sigma$ (Lock 3): All setting values can be changed,
  however, they returns to their former value after the power is turned off because they are not stored in the non-volatile memory. | Unlock |
| $\phi$H | Main setting value high limit setting
- Sets the high limit value for the main setting.
- Main setting value low limit to Rated maximum value | Rated maximum value |
| $\phi$L | Main setting value low limit setting
- Sets the low limit value for the main setting.
- Rated minimum value to Main setting value high limit | Rated minimum value |
### Sensor correction setting
- Sets sensor correction value of the sensor.
- -199 to 200°C (°F), or -19.9 to 20.0°C

<table>
<thead>
<tr>
<th>Character</th>
<th>Name, Description, Setting range</th>
<th>Initial</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sensor correction setting</td>
<td></td>
<td>0°C</td>
</tr>
</tbody>
</table>

### Instrument number setting
- Sets the Instrument number individually to each instrument when communicating by connecting multiple instruments in serial communication.
- This setting item is available only when the option [CR5] is applied.
- 0 to 95

<table>
<thead>
<tr>
<th>Character</th>
<th>Name, Description, Setting range</th>
<th>Initial</th>
</tr>
</thead>
<tbody>
<tr>
<td>Instrument number setting</td>
<td></td>
<td>0</td>
</tr>
</tbody>
</table>

### Transfer rate selection
- Selects the communication transfer rate to meet the rate of the host computer.
- This setting item is available only when the option [CR5] is applied.
- 2400bps: 24
- 4800bps: 48
- 9600bps: 96
- 19200bps: 192

<table>
<thead>
<tr>
<th>Character</th>
<th>Name, Description, Setting range</th>
<th>Initial</th>
</tr>
</thead>
<tbody>
<tr>
<td>Transfer rate selection</td>
<td></td>
<td>9600bps</td>
</tr>
</tbody>
</table>

### Sensor correction function
This corrects the input value from the sensor. When a sensor cannot be set at a location where control is desired, the sensor measuring temperature may deviate from the temperature in the controlled location. When controlling with multiple controllers, the accuracy of sensors has influence on the control. Therefore, sometimes the measuring temperature (input value) does not concur with the same setting value. In such a case, the control can be set with desired temperature by shifting the input value of sensors.

### 3.6 Auxiliary function setting mode 2

<table>
<thead>
<tr>

</table>

### Temperature alarm 2 (A2) hysteresis setting
- Sets hysteresis value for temperature alarm 2 (A2) output.
- This setting item is not available if the option [2AS] or [2AL] is not applied, or “no alarm” is selected in Temperature alarm 2 (A2) action selection.

<table>
<thead>
<tr>
<th>Setting</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.0°C</td>
<td>-</td>
</tr>
</tbody>
</table>
### Temperature alarm 1 (A1) action delayed timer setting
- Sets the action delayed timer for temperature alarm 1 (A1).
- Alarm will be activated when the setting time is passed after the input enters the alarm output range.
- This setting item is not available for the CS3S-30 type or if “no alarm” is selected in Temperature alarm 1 (A1) action selection.
- 0 to 999 seconds

### Temperature alarm 2 (A2) action delayed timer setting
- Sets the action delayed timer for temperature alarm 2 (A2).
- Alarm will be activated when the setting time is passed after the input enters the alarm output range.
- This setting item is not available if option [2AS] or [2AL] is not applied, or “no alarm” is selected in Temperature alarm 2 (A2) action selection.
- 0 to 999 seconds

### Output Direct/Reverse change
- Changes the output action Reverse (Heating) or Direct (Cooling).
- Reverse (Heating) action: \( H \)
- Direct (Cooling) action: \( C \)

### Auto-tuning bias setting
- Sets PID auto-tuning bias value by which the auto-tuning point is decided automatically by the deviation between PV and SV.
- 0 to 50°C (0 to 100°F), or 0.0 to 5.0°C

#### Energized/Deenergized function

- **Energized** function:
  - When the alarm output indicator is lit, the alarm output (between terminal 3-4, or 3-5) is conducted (ON).
  - When the alarm output indicator is unlit, the alarm output is not conducted (OFF).

- **Deenergized** function:
  - When the alarm output indicator is lit, the alarm output (between terminal 3-4, or 3-5) is not conducted (OFF).
  - When the alarm output indicator is unlit, the alarm output is conducted (ON).

#### Control output OFF function
- **Character**: \( \text{OFF} \)
- **Name, Descriptions**:
  - This is the function to make the control output OFF even if the power to the instrument is supplied.
  - The function is used when required to halt the control action or the CS3S is not used in multiple controllers.
  - \( \text{OFF} \) is indicated on the PV display while the function is working.
  - This function can be selected from any mode or from any setting item by pressing the \( \text{OFF} \) key for approx. 1 second.
  - Once the function is worked, the function cannot be released even if the power to the instrument is turned off and on again.
  - To cancel the function, press the \( \text{OFF} \) key again for approx. 1 second.
3.8 Output manipulated variable indication

<table>
<thead>
<tr>

</tr>
</thead>
<tbody>
<tr>
<td>Output manipulated variable indication</td>
</tr>
<tr>
<td>Press the key for 3 seconds on the PV/SV display mode.</td>
</tr>
<tr>
<td>The main setting mode appears in the process, however, if the key is pressed continuously, output manipulated variable is indicated on the SV display and the decimal point blinks every 0.5 seconds.</td>
</tr>
<tr>
<td>By pressing the key again, the mode reverts to the PV/SV display mode.</td>
</tr>
</tbody>
</table>

4. Running
After the mounting to the control panel and wiring connections are complete, start running in the following manner.

(1) Turn the power supplied to the CS3S ON.
For approx. 2s after the power on, the characters of the sensor type and temperature unit are indicated on the PV display, and the rated maximum value is indicated on the SV display. See [table 3.1-1]. (If any other value is set at the main setting value high limit setting, SV display indicates the value.)
During this time, all outputs and LED indicators are in their off status.
After that, the PV display indicates the current temperature, and the SV display indicates the main setting value.
While the Control output OFF function is working, [ ] is indicated on the PV display.

(2) Input the setting value
Referring to Chapter 3. Operation, input each setting value.

(3) Turn the load circuit power ON.
Starts the control action so as to maintain the controlled object at the main setting value.

5. Other functions

(1) Input burnout indicating function
When the input value rises to the value greater than 999 or 99.9, the PV display blinks 3 digits. When the input value exceeds [the rated scale maximum value + 50°C (100°F)], the controlling output is turned OFF (for the current output type, output low limit value), and the PV display blinks [ ].
When the input falls below –199 (–19.9), the PV display blinks 3 digits.
When the thermocouple input value falls below –50°C (–100°F), the controlling output is turned OFF (for the current output type, output low limit value), and the PV display blinks [ ].
For the RTD input whose rated scale minimum value is –19.9, if the input value falls below –50°C (–100°F), the controlling output is turned OFF (for the current output type, output low limit value), and the PV display blinks [ ].
For the RTD input whose rated scale minimum value is –199, if the input value falls below [–199°C –1% of rated scale span], the controlling output is turned OFF (for the current output type, output low limit value), and the PV display blinks [ ].

(2) Sensor burnout function
When the thermocouple or RTD is burnt out, the controlling output is turned OFF (for the current output type, output low limit value), and the PV display blinks [ ].

(3) Self-diagnosis function
The CPU is monitored by a watchdog timer, and when any abnormal status is found on the CPU, the controller is switched to warm-up status.

(4) Automatic cold junction temperature compensation (thermocouple input type)
This detects the temperature at the connection terminal between thermocouple and the instrument, and always keeps it on the same status at which the reference junction is located at 0°C (32°F).

7. PID auto-tuning of the CS3S

In order to decide each value of P, I, D and ARW automatically, this system gives the fluctuation to the controlled object.

* When the difference between setting value and processing temperature is large when the temperature rises.

Fluctuation is given at the temperature, which is the adjusted bias setting value (e.g. 20°C) lower than the setting value.

- PID parameter measuring
- PID parameter calculated point
- Controlling action is performed with the parameters set by auto-tuning.
- AT bias setting value

* When the control is stable

Fluctuation is given at the setting value.

- PID parameter measuring
- PID parameter calculated point
- Controlling action is performed with the parameters set by auto-tuning.

* When the difference between the setting value and processing temperature is large when the temperature falls.

Fluctuation is given at the temperature, which is the adjusted bias setting value (e.g. 20°C) higher than the setting value.

- PID parameter measuring
- PID parameter calculated point
- Controlling action is performed with the parameters set by auto-tuning.
- AT bias setting value

AT : Auto-tuning starting point
8. Mounting to the control panel

8.1 Site selection
This instrument is intended to be used under the following environmental conditions (IEC61010-1):
Overvoltage category II, Pollution degree 2

Mount the controller in a place with:
(1) A minimum of dust, and an absence of corrosive gases
(2) No flammable, explosive gases
(3) No mechanical vibrations or shocks
(4) No exposure to direct sunlight
(5) An ambient temperature of 0 to 50°C (32 to 122°F) that does not change suddenly
(6) An ambient non-condensing humidity of 35 to 85%RH
(7) The controller away from large capacity electromagnetic switches or cables through which
    large current is flowing
(8) No water, oil or chemicals or where the vapors of these substances can come
    into direct contact with the controller

8.2 External dimension drawing

When one-touch type mounting bracket is used

[Fig. 8.2-1]

When screw type mounting bracket is used

n: Number of units mounted
8.4 Current transformer (CT) dimension drawings

![CTL-6-S (for 20A)](CTL-6-S.png)

8.5 Mounting

When the **one-touch mounting bracket** is used:
- Mounting panel thickness is 1 to 3mm.
- Catch the mounting bracket ① to the top and bottom of the instrument first.
- Then, insert the CS3S ② from the front of the mounting panel.

When the **screw bracket** is used:
- Mounting panel thickness is 1 to 15mm.
- Insert the CS3S from the front of the panel.
- Catch the mounting bracket to the holes top and bottom of the case, and screw to fix.
- When the Soft-type Front-cover (option [IS5]) is applied, mounting panel thickness is 1 to 14.5mm.

Notice
As the case is made of resin, do not use excessive force while screwing in the mounting bracket.
The torque is approximately 0.12 Nm.
9. Terminal arrangement

**Warning**

Turn the power supply to the instrument OFF before wiring or checking. Working or touching the terminal with the power switched ON may result in an Electric Shock which could cause severe injury or death.

**Notice**

- The terminal block of the CS3S is designed to be wired from the left side. The lead wire must be inserted from the left side of the terminal, and fastened with the terminal screw.
- Use a thermocouple and compensating lead wire according to the input specification of this controller.
- Use a 3-wire system of RTD according to the input specification of this controller.
- This controller has neither built-in power switch nor fuse. Therefore, it is necessary to install them in the circuit near the external controller.
  (Recommended fuse: Time-lag fuse, rated voltage 250V, rated current 2A)
- **In the case of 24Vdc for power source, do not confuse the polarity.**
  - With the relay contact output type, externally use an auxiliary electromagnetic switch according to the capacity of the load to protect the built-in relay contact.
  - When wiring, keep input wire (thermocouple, RTD, etc.) away from AC source and load wire to avoid external interference.

**Solderless terminal**

Use a solderless terminal with an insulation sleeve that fits to an M3 screw as shown below.
Option: Heater burnout alarm output
(1) This alarm is not available for detecting current under phase control.
(2) Use the current transformer (CT) provided, and pass a lead wire of the heater circuit into the hole of the CT.
(3) When wiring, keep the CT wire away from any AC sources or load wires to avoid the external interference.

10. Specifications

10.1 Standard specifications
Mounting method: Flush
Setting: Input system using membrane sheet key
Display
PV display: Red LED display 3 digits, size 5.5(W) x 10(H) mm
SV display: Green LED display 3 digits, size 4(W) x 8(H) mm
Accuracy (Setting and Indication)
Thermocouple: Within ±0.3% of input range full scale ±1 digit, or within 2°C (4°F) whichever is greater
RTD: Within ±0.2% of input range full scale ±1 digit, or within 1°C (2°F) whichever is greater
Input sampling period: 0.25 seconds

Input
Thermocouple: K, J, E
External resistance, 100Ω or less
When input burnout, Upscale
RTD: Pt100, JPt100 3-wire system
Allowable input lead wire resistance, 10Ω or less per wire
When input burnout, Overscale

Control output
Relay contact: 1a
Control capacity, 250Vac 3A (resistive load)
250Vac 1A (inductive load cosø=0.4)
Non-contact voltage: For SSR drive
12 0 +2 Vdc Maximum 40mA (short circuit protected)
Current: 4 to 20mAdc
Load resistance, maximum 550Ω

Temperature alarm 1 (A1) output
Action: ON/OFF action
Hysteresis, 0.1 to 99.9°C (°F)
Output: Relay contact, 1a
Control capacity, 250Vac 3A (resistive load)
250Vac 1A (inductive load cosø=0.4)

Control action
PID action (with auto-tuning function)
PD action (with auto-reset function) (When setting the integral time to 0.)
Proportional band: 0 to 999°C (°F) or 0.0 to 99.9°C
(ON/OFF action when set to 0 or 0.0)
Integral time: 0 to 999s (off when set to 0)
Derivative time: 0 to 300s (off when set to 0)
Proportional cycle: 1 to 120s (not available for the current output type)
ARW: Automatic
Output limit: 0 to 100% (–5 to 105% for the current output type)
ON/OFF action (When setting proportional band value to 0 or 0.0.)
Hysteresis: 0.1 to 99.9°C (°F)
Circuit insulation configuration

* In the case the type of main output is Current output or Non-contact voltage output, it is not isolated between output and input, and between output and CT input.

**Insulation resistance**
10MΩ or greater at 500Vdc
In the case of the above circuit insulation configuration (*), between the output and input, and between the output and CT input, the resistance insulation test must not be carried out because between them are not isolated.

**Dielectric strength**
Between input terminal and ground ......................... 1.5kVac for 1 minute
Between input terminal and power terminal ............. 1.5kVac for 1 minute
Between output terminal and ground .................... 1.5kVac for 1 minute
Between output terminal and power terminal .......... 1.5kVac for 1 minute
Between power terminal and ground ..................... 1.5kVac for 1 minute

**Supply voltage**
: 100 to 240Vac, 50/60Hz, 24Vac/dc, 50/60Hz

**Allowable voltage fluctuation**
: In the case of 100 to 240Vac, 85 to 264Vac
In the case of 24Vac/dc, 20 to 28Vac/dc

**Power consumption**
: Approx. 8VA

**Ambient temperature**
: 0 to 50°C (32 to 122°F)

**Ambient humidity**
: 35 to 85%RH (non-condensing)

**Weight**
: Approx. 130g

**External dimension**
: 48 x 48 x 96.5mm (W x H x D)

**Material**
: Flame resistance resin (case)

**Color**
: Black (case)

**Attached functions**
: Control output OFF function
: Setting value lock function
: Sensor correction function
: Power failure compensating function
: Self-diagnosis function
: Automatic cold junction compensating function
: Sensor burnout function
: Input burnout indicating function

**Accessories**
: One-touch mounting bracket 1 set
(When the mounting provision [FS] is applied, Screw bracket 1 set)
: Terminal cover 1 piece (when option [KAB] is applied)
: Current transformer 1 piece
: CTL-6S, when option [W10], [W11], [W12] is applied
: CTL-12-S36-10L1, when option [W15] is applied
10.2 Optional specifications

**Alarm output 2 (A2) process value monitoring** [Option codes: 2AS or 2AL]
- The options [SV2] or [W1x] cannot be applied in combination with this option.
- When the option [2AL] process value and loop monitoring is selected, the output terminal is common.
  - **Action**: ON/OFF action
  - **Hysteresis**: 0.1 to 99.9°C (°F)
  - **Output**: Relay contact, 1a
  - **Control capacity**: 250Vac 3A (resistive load)
  - 250Vac 1A (inductive load cosø =0.4)

**Alarm output 2 (A2) loop break alarm** [Option codes: 2AR or 2AL]
- The alarm will be activated when the process variable (PV) does not change as much value as the setting span or greater within the time it takes to assess the loop break alarm after the manipulating value reaches the maximum value or the minimum value.
- Also, this detects heater burnout, sensor burnout and abnormality at operation end.
- The options [CR5], [SV2] or [W1x] cannot be applied in combination with this option.
  - When the option [AL] process value and loop monitoring is selected, the output terminal is common.
  - **Loop break alarm action time**: 0 to 200 minutes
  - **Loop break alarm action span**: 0 to 150°C (°F)
  - **Output**: Relay contact, 1a
    - **Control capacity**: 250Vac 3A (resistive load), 250Vac 1A (inductive load, cosø=0.4)

**Heater burnout alarm output** [Option codes: W10, W11, W12, W15]
- Watches the heater current with CT (current transformer), and detects the burnout.
- The options [2AS], [2AR], [2AL], [SV2] or [CR5] cannot be applied in combination with this option.
- This option cannot be applied to the current output type.
  - **Rating**:
    - or 50A [Option W15] (Must be designated)
  - **Setting range**:
    - In the case of 5A [W10], 0.0 to 5.0A (off when set to 0.0)
    - In the case of 10A [W11], 0.0 to 10.0A (off when set to 0.0)
    - In the case of 20A [W12], 0.0 to 20.0A (off when set to 0.0)
    - In the case of 50A [W15], 0.0 to 50.0A (off when set to 0.0)
  - **Setting accuracy**: Within ±5% of the rated value
  - **Action**: ON/OFF action
  - **Output**: Relay contact, 1a
    - **Control capacity**: 250Vac 3A (resistive load)
    - 250Vac 1A (inductive load cosø =0.4)

**Serial communication** [Option code: CR5]
- The options [SV2], [2AR], [2AL] or [W1x] cannot be applied in combination with this option.
- The following operations can be executed from the external computer.
  1. Reading and setting of the main setting value, PID values and various setting values
  2. Reading of the input value and action status
  3. Change of the functions
- **Communication circuit**: Based on EIA RS-485
- **Communication method**: Half-duplex communication start-stop synchronous
- **Transfer rate**: 2400, 4800, 9600 and 19200bps (selectable by key operation)
- **Data format**:
  - Start bit: 1
  - Data bit: 7
  - Parity: Even
  - Stop bit: 1
Setting value memory (external selection) [Option code: SV2]
If this option is applied, the main setting value 1 or main setting value 2 can be selected by external contact.
The option [2AS], [2AR], [2AL], [CR5], or [W1x] cannot be applied in combination with this option.

Screw type mounting bracket [Mounting provision code: FS]
Mounting panel thickness: 1 to 15mm

Dust-proof · Drip-proof [Option code: IP4 or IS5]
Dust-proof and Drip-proof specification IP54 at option [IP4] by use of two additional gaskets.
Dust-proof and Drip-proof specification IP55 at option [IS5] by use of an additional front cover.
The IP-Protection is only effective to the front of the controller, case part is excluded.
To protect the controller from water leak between the control panel and controller, the control panel surface to be mounted should be planar and vertical.

Terminal cover [Option code: KAB]
Electrical shock protecting terminal cover

11. Troubleshooting

If any malfunctions occur, refer to the following items after checking the power supply and wiring.

<Indication>

<table>
<thead>
<tr>
<th>Phenomena</th>
<th>Presumed cause and solution</th>
</tr>
</thead>
</table>
| If the PV display is indicating [0°F]. | · Control output OFF function is working.  
   ➤ Press the \( \bigcirc \) key for approx. 1s to release the function. |
| If [ ] is blinking on the PV display. | · Thermocouple or RTD is burnt out.  
   [In the case of Thermocouple]  
   If the input terminal of the instrument is connected, and if near room temperature is indicated, the instrument should be normal and sensor may be burnout.  
   [In the case of RTD]  
   If approx. 100Ω of resistance is connected to the input terminal between A-B of the instrument and between B-B is connected, and if near 0°C (32°F) is indicated, the instrument should be normal and sensor may be burnout.  
   · Lead wire of thermocouple or RTD is not securely mounted to the instrument terminal. |
| If [ ] is blinking on the PV display. | · Polarity of thermocouple or compensating lead wire is reversed.  
   · Codes (A, B, B) of RTD do not agree with the instrument terminal. |
| If indication of the PV display is abnormal or unstable. | · Designation of the sensor input is improper.  
   · Temperature unit (°C or °F) is mistaken.  
   · Sensor correction value is not appropriate.  
   ➤ Set the value properly.  
   · Specification of the thermocouple or RTD is improper.  
   · AC leaks into the thermocouple or RTD circuit.  
   · There may be an equipment producing an inductive fault or noise near the controller. |
